The Characteristic Polynomical, contbl Recall from last time: · An eigenvector of A is a vector v such that Av=Xv λ = eigenvalue • The λ -eigenspace is Nul (A-XIn) = Sall &-ergenvectors and O? • The characteristic polynomial of A B p(X)= det(A-XIn) The eigenvalues are the solutions of $p(\lambda)=0$. · We like eigenvectors because $A_{v} = \lambda v \Longrightarrow A^{k} v = \lambda^{k} v$ so we can use these to solve the difference of VK+1 = AVK ~> VK= AKV What kind of function is p(2)? What does it look like?

2. So
$$cose: A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

 $dot(A - \lambda I_{2}) = dot\begin{pmatrix} a - \lambda & b \\ c & d - \lambda \end{pmatrix} = \begin{pmatrix} a - \lambda \end{pmatrix}(d - \lambda) - bc$
 $= \lambda^{2} - (a + d)\lambda + (ad - bc)$
 $dot(A)^{7}$
This is a polynomial of cligner 2 (quadrattic).
Def: The trace of a matrix A is
 $Tr(A) =$ the sum of the diagonal entries of A.
Eq: A = \begin{pmatrix} a & b \\ c & \lambda \end{pmatrix} $Tr(A) = a + d$

Characteristic Polynomial of a
$$2x^2$$
 Matrix A
 $p(\lambda) = \chi^2 - Tr(A)\lambda + det(A)$

NB:
$$p(o) = det(A - OIn) = det(A)$$

so the constant term is always det(A).
We know how to factor quadratic polynomials:
the quadratic formula!

Ey: Find all eigenvalues of
$$A = \begin{pmatrix} 2 & 1 \\ 2 & 2 \end{pmatrix}$$

 $T_r(A) = 4$ dot $(A) = 3$
 $p(X) = X^2 - 4X + 3 = 0$
 $\implies X = \frac{1}{2} \begin{pmatrix} 4 \pm \sqrt{16-12} \end{pmatrix} = \frac{1}{2} \begin{pmatrix} 4\pm 2 \end{pmatrix} = 2\pm 1$
so the eigenvalues are 1 and 3.
General Form: If A is an nxn matrix, then
 $p(X) = (-1)^n X^n + (-1)^{n-1} T_r(A) X^{n-1}$
 $+ (other terms) + dot(A)$
 \rightarrow This is a degree-n polynomial
 \Rightarrow You only get the X^{n-1} and constant coeffs
"for free" - the rest are more complicated.
"for free" - the rest are more complicated.
Eg: $A = \begin{pmatrix} 1^n & 1^2 & 1^2 \\ 0 & 1^2 & 0 \end{pmatrix} \implies p(X) = -X^2 + \begin{pmatrix} 1^2 & 1^2 \\ 4 & 4 \end{pmatrix} + \frac{3}{2}$
 $T_r(A) = 0 + 0 + 0 = 0 \checkmark dot(A) = -\frac{1}{4} \cdot \begin{pmatrix} -1^2 \\ 2 \end{pmatrix} = \frac{3}{2} \checkmark$
Fact: A polynomial of degree n has at most n pots
Consequence: An nxn matrix has at most n
eigenvalues

How do we find the roots of a degree-n polynomial?
In real life: ask a computer
NB the computer will twin this back into an eigenvalue problem and will use a different (faster) eigenvalue-finding algorithm
By hand: I won't ask you to factor any polynomials of degree ≥3 by hand.
NB: This is not a Gaussian elimination problem.

Diagonalization Solving a difference equation Vieti=Avie is easy when Vo is an eigenvector: $Av_{k} = \lambda v_{0} \implies v_{k} = A^{k}v_{0} = \lambda^{k}v_{0}$ It is also easy if Vo B a linear combination of eigenvectors: suppose $v_0 = x_1 w_1 + \cdots + x_n w_n$ where $Aw_i = \lambda_i w_i$. Then Vk=Akvo=Ak(X,Wi+····+X,Wn) (multiplication?) = $X_{k}A^{k}\omega_{k} + \cdots + X_{n}A^{k}\omega_{n} = X_{k}X_{k}^{k}\omega_{k} + \cdots + X_{n}X_{n}^{k}\omega_{n}$ IF AW,=>IW, AUS= NZWZ, ..., AV=>nWn, then $A^{k}(x_{i}w_{i}+\cdots+x_{n}w_{n})=\lambda_{i}^{k}x_{i}w_{i}+\cdots+\lambda_{n}^{k}x_{n}w_{n}.$

JUST DISTRIBUTE!

Rabbit Example Control: We computed the matrix

$$A = \begin{pmatrix} 0 & 13 & 12 \\ 0 & 12 & 0 \end{pmatrix} \text{ has eigenvalues } 2_{3} - \frac{1}{3}, -\frac{3}{2}$$
Compute eigenspaces (bases for Nul(A-XI_3)):
2: Span $\left\{ \begin{pmatrix} 32\\ 1 \\ 1 \end{pmatrix} \right\}^{2} - \frac{1}{2}$: Span $\left\{ \begin{pmatrix} 2\\ -1 \end{pmatrix} \right\}^{2} - \frac{3}{2}$: Span $\left\{ \begin{pmatrix} 18\\ -1 \end{pmatrix} \right\}^{2}$
Let's give names to some eigenvectors:

$$U_{1} = \begin{pmatrix} 32\\ -1 \end{pmatrix} \quad U_{2} = \begin{pmatrix} 2\\ -1 \end{pmatrix} \quad U_{3} = \begin{pmatrix} 18\\ -1 \end{pmatrix}$$
Can we write our initial state $V_{0} = (16, 6, 1)$
as a LC of U_{1}, U_{2}, U_{3} ? Need to solve

$$\begin{pmatrix} 16\\ 9\\ -1 \end{pmatrix} = X_{1} \begin{pmatrix} 32\\ -1 \end{pmatrix} + X_{2} \begin{pmatrix} 2\\ -1 \end{pmatrix} + X_{3} \begin{pmatrix} 18\\ -3 \end{pmatrix}$$
Augmented $\begin{pmatrix} 32\\ -1 & -3 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} 16\\ -1 & -3 \\ 1 & 1 \end{pmatrix} \begin{pmatrix} 16\\ -1 & -3 \\ -1 & -3 \end{pmatrix} = \begin{pmatrix} 16\\ -1 & -3 \\ -1 & -3 \\ -1 & -3 \end{pmatrix}$
So $V_{0} = U_{1} + U_{2} - U_{3}$

$$= V_{\mu} = A^{k} V_{a} = D^{k} \omega_{1} + (-\frac{1}{2})^{k} \omega_{2} - (-\frac{3}{2})^{k} \omega_{3}$$

$$= \begin{pmatrix} 32 \cdot 2^{k} + 2 \cdot (-\frac{1}{2})^{k} - 18 \cdot (-\frac{3}{2})^{k} \\ 4 \cdot 2^{k} - (-\frac{1}{2})^{k} + 3 \cdot (-\frac{3}{2})^{k} \\ 2^{k} + (-\frac{1}{2})^{k} - (-\frac{3}{2})^{k} \end{pmatrix}$$

$$= \begin{pmatrix} doed form; no method multiplication \end{pmatrix}$$

Observation 1: $2^k \gg |(-\frac{1}{2})^k|$ and $|(-\frac{3}{2})^k|$ for large k 50 Akvon Dkw, (most significant digits) This explains why eventually, • ratios converge to (32:4:1) · population roughly doubles each year Observation 2: Jui, w2, w3 is linearly independent (this is automatic more later) Jui, wz, wz Z is a basis for IR3 > any vector in R3 is a linear combination of why way way So if $v_0 = x_1 w_1 + x_2 w_2 + x_3 w_3$ then $A^{k}v_{0} = x_{1}A^{k}\omega_{1} + x_{2}A^{k}\omega_{2} + x_{3}A^{k}\omega_{3}$ = $\int_{k} x_{1} w_{1} + \left(-\frac{1}{2}\right)^{k} x_{2} w_{2} + \left(-\frac{3}{2}\right)^{k} x_{3} w_{3}$ So observation 1 holds for any initial state $V_3 \in \mathbb{R}^s$. Q: What if $x_1 = 0$? The fact that A has 3 LI eigenvectors means we can understand how A acts on IR³ entirely in ferms of its eigenvectors & eigenvalues.

Def: Let A be an own matrix. A is dragonalizable if it has a linearly independent eigenvectors w..., v. In this case, Swy-ywin 3 is called an eigenbasis.

In this cose, any vector in R[®] is a linear combination of eigenvectors. Writing a rector as a LC of eigenvectors is called expanding in an eigenbasis. -> This means solving the vector equation $V=X_1W_1+X_2W_2+\cdots+X_nW_n.$ or the matrix equation this notice (1, ... where x = V is not A! Important! When working with a diagonalizable matrix, everything is much easier if you expand your vectors in an eigenbasis!

Procedure for Diagonalizing a Matrix:
Let A be an nxn natrix.
(1) Compute the characteristic polynomial

$$p(X) = det (A - \lambda In)$$

(2) Factor $p(X)$ to find the eigenvalues of A.
(3) Find a basis for each eigenspece.
(4) Combine your bases in (3).
• IF you have n vectors, they form an
eigenbasis.
• Otherwise, A is not diagonalizable.
Eq: We ran this procedure on $A = \begin{pmatrix} 0 & 13 & 12 \\ VI4 & 0 & 0 \\ 0 & VI2 & 0 \end{pmatrix}$
above.

For Solve the difference equation

$$V_{kx} = Av_{k} \quad \text{for} \quad A = \begin{pmatrix} 14 & -18 & -33 \\ 12 & -18 & -31 \end{pmatrix} \quad v_{k} = \begin{pmatrix} 6 \\ 2 \end{pmatrix}$$
First we diagonalize A.

$$p(\lambda) = det \begin{pmatrix} 14-\lambda & -18 & -33 \\ -12 & -18 & -31-\lambda \end{pmatrix}$$

$$= \begin{pmatrix} 14-\lambda \end{pmatrix} dot \begin{pmatrix} 20-\lambda & 35 \\ -18 & -31-\lambda \end{pmatrix} - 12(-1) det \begin{pmatrix} -18 & -39 \\ -18 & -31-\lambda \end{pmatrix}$$

$$+ 12 det \begin{pmatrix} -19 & -23 \\ 20-\lambda & 33 \end{pmatrix}$$

$$= \cdots = -\lambda^{3} + 3\lambda^{3} - 44$$
Ask a computer for the nots:

$$p(\lambda) = -(\lambda - 2)^{2}(\lambda + 1) \quad \text{true?}$$
So the eigenvalues are $\lambda = 2$ and $\lambda = -1$.
Let's find bases for eigenspaces:

$$h = \begin{pmatrix} 1-2 & -18 & -33 \\ 20-\lambda & -21 \\ 12 & -18 & -33 \end{pmatrix} \inf \begin{pmatrix} 0 & -34 & -194 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 1-2 & -18 & -33 \\ 12 & -18 & -33 \end{pmatrix} \inf \begin{pmatrix} 0 & -34 & -194 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 1-2 & -18 & -33 \\ 12 & -18 & -33 \end{pmatrix} \inf \begin{pmatrix} 0 & -34 & -194 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 12 & -18 & -33 \\ 12 & -18 & -33 \end{pmatrix} \inf \begin{pmatrix} 0 & -34 & -194 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 12 & -18 & -33 \\ 12 & -18 & -33 \end{pmatrix} \inf \begin{pmatrix} 0 & -34 & -194 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 12 & -18 & -33 \end{pmatrix} \inf \begin{pmatrix} 0 & -34 & -194 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 12 & -18 & -33 \end{pmatrix} \inf \begin{pmatrix} 0 & -34 & -194 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -33 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -31 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -31 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -31 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -31 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21 & -18 & -31 \\ 0 & 0 & 0 \end{pmatrix}$$

$$= \begin{pmatrix} 14 & -21$$

$$\begin{array}{c} \lambda = -1: \quad A + I_{3} = \begin{pmatrix} 15 & -18 & -33 \\ -12 & 21 & 33 \\ 12 & -18 & -30 \end{pmatrix} \stackrel{\text{ref}}{\longrightarrow} \begin{pmatrix} 1 & 0 & -1 \\ 0 & 1 & 1 \\ 0 & 0 & 0 \end{pmatrix} \\ \begin{array}{c} \text{PVF} \\ \text{WF} \\ \text{WF} \\ \text{WS} \\ \begin{array}{c} N_{2} \\ N_{3} \end{array} = X_{3} \begin{pmatrix} 1 \\ -1 \\ 1 \end{pmatrix} \stackrel{\text{basis}}{\longrightarrow} W_{3} = \begin{pmatrix} -1 \\ -1 \\ 1 \end{pmatrix} \end{array}$$

We have 3 exervectors why way as I is diagonalizable with eigenbasis

$$\begin{cases} \omega_{1}, \omega_{2}, \omega_{3} \rangle = \begin{cases} \begin{pmatrix} 3 \\ 2 \end{pmatrix}, \begin{pmatrix} 1 \\ 9 \end{pmatrix}, \begin{pmatrix} 1 \\ 7 \end{pmatrix} \end{cases}$$

$$Now \quad \omega e \quad expand \quad V_{0} = \begin{pmatrix} 6 \\ 2 \end{pmatrix} \quad in \quad our \quad eigenboosts:$$

$$\begin{pmatrix} 6 \\ 2 \end{pmatrix} = \chi_{1} \begin{pmatrix} 3 \\ 0 \end{pmatrix} + \chi_{2} \begin{pmatrix} 1 \\ 9 \\ 7 \end{pmatrix} + \chi_{3} \begin{pmatrix} 1 \\ 7 \\ 7 \end{pmatrix}$$

$$\lim_{n \neq 1} \begin{pmatrix} 3 \\ 1 \\ 0 \end{pmatrix} + \frac{1}{n} \begin{pmatrix} 6 \\ 0 \end{pmatrix} \quad \inf_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix} 1 \\ 0 \end{pmatrix} \quad \bigoplus_{n \neq 1} \begin{pmatrix}$$

$$\sim$$
 $V_{a} = - (v_{1} + v_{2} - 2) v_{3}$

Now we're done: $V_{k} = A^{k}v_{b} = -D^{k}w_{1} + 2^{k}\omega_{2} - D(-1)^{k}w_{3}$ $= -D^{k} \begin{pmatrix} 3 \\ 2 \end{pmatrix} + 2^{k} \begin{pmatrix} 11 \\ 4 \end{pmatrix} - 2(-1)^{k} \begin{pmatrix} 1 \\ -1 \end{pmatrix}$ $= \begin{pmatrix} 8 \cdot 2^{k} - 2 \cdot (-1)^{k} \\ -2 \cdot 2^{k} + 2 \cdot (-1)^{k} \end{pmatrix} \leftarrow \begin{array}{c} closel \\ required \\ required \\ required \\ required \\ NB: 2^{k} \gg (-1)^{k}, \quad so \quad V_{k} \sim D^{k} (w_{2} - w_{1}) = 2^{k} \begin{pmatrix} 8 \\ -2 \end{pmatrix}$ $as \ k \rightarrow \infty$

Eg: A = ('o i')
$$p(x) = \lambda^2 - T_r(A) \lambda + det(A)$$

 $= \lambda^2 - 3\lambda + 1 = (\lambda - 1)^2$
The only eigenvalue is 1, and the 1-eigenspe is
 $Nul(A - I_2) = Nul(o i) = Span \{(o)\}^2$
We only got one eigenvector (130) and not two:
 \Rightarrow not diagonalizable! (all eigenvectors lie on the
 $x - axis.)$
So we can't use diagonalization to solve
 $V_{k+1} = ('o i') V_k$.
NB: The shear should be your formite example of a
non-diagonalizable matrix.
Ect: A matrix with "random entries" will be
diagonalizable.

In the disjonalization proceedure, how did we know that when we combined our eigenbases we would get a Inearly independent set of vectors? Fact: If why many are eigenvectors of A with different eigenvalues then Swa-hup? is LI. More on this next time.
